FestPass – Campus Event Registration

Jenkins CI Assignment | Evidence Summary

Repository	https://github.com/SamarChaubey/festpass-java
Jenkins job	festpass-ci
Final result	**SUCCESS – 28 tests passed** (as confirmed by the student)
Fix implemented	Updated BookingService.cancel() to remove the student ID from the event's registration set, freeing the seat and allowing cancellation state to be persisted by the existing workflow.

1. Initial failure and diagnosis

The initial test run completed 28 tests with 3 failures: **cancellationFreesSeat**, **cancellationsSurviveReload**, and **cliWorkflowPersistsAcrossCommands**. The failures indicated that cancellation did not remove a student from the event's booking set. Consequently, seats remained occupied and the cancelled state was not reflected in later reads.

2. Code change

The cancel method was changed to remove the student ID after validating the event and booking. If removal returns false, it throws the existing “No booking for student” error. The supplied tests and pipeline checks were left unchanged.

```
Core operation: if (!event.students.remove(studentId)) { throw new IllegalArgumentException(...); }
```

3. Pipeline behaviour and final verification

Failed build	Test stage failed; Build JAR, Smoke test JAR, and Save artifact were skipped. The diagnostic submission-evidence.csv was archived.
Successful build	Student confirmed Jenkins reported SUCCESS with all 28 tests passing. Successful JAR and evidence CSV were downloaded.
JAR check	Running the JAR with the help command displayed usage, supported commands, default data file, ID rules, and exit codes.
Automatic trigger	Jenkins SCM-triggered builds were observed during the workflow. Final post-fix automatic build details should be verified from the Jenkins build history.

4. Build evidence references

Repository: https://github.com/SamarChaubey/festpass-java
Failed run shown in the provided console log: build #9, commit 6b6af61 (submission setup succeeded; 3 test failures).
Successful build number and commit ID: add from the final green Jenkins build before submission.

Attachments to submit: source repository, failed-build submission-evidence.csv, successful-build submission-evidence.csv, final festpass.jar, and this evidence page. Replace the successful build number and commit ID above with the exact values from Jenkins.
